Update on diagnostic and therapy in CTD-ILD

Prof. Anna-Maria Hoffmann-Vold
Oslo University Hospital

The 2025 ERS/EULAR guidelines introduce a novel framework for connective tissue disease-associated interstitial lung disease (CTD-ILD) that highlight the importance of early detection and phenotype directed management. This talk will outline the guidelines' standardized screening algorithm based on high resolution CT, risk assessment at diagnosis, and standardized monitoring approaches based on risk stratification. Recommended treatment algorithms based on clinical phenotypes will be discussed, including when to use immunomodulatory agents or combined strategies. The latest research findings in this field will also be presented.
